CAP776: PROGRAMMING IN PYTHON

MINOR PROJECT #1 REPORT

MY DATA, MY STORY

Personal Activity Intelligence Report

Student Details	Info
Student Name	Satyam Kumar
Registration / Roll No.	54
Program / Section	D1P2635
Activity Recording Period	17 August 2026 to 21 September 2026
Date of Report Generation	26 September 2026

1. Activity Data Summary

Particular	Value
Expected number of days	36
Valid days recorded	39
Missing days	0
Invalid / excluded records	0
Average Sleep/day	433.33 min (7.22 hrs)
Average Fitness/day	51.41 min
Average Study/day	237.64 min (3.96 hrs)
Average Coding/day	54.49 min (0.91 hrs)
Average Class/day	205.13 min
Average Other Activities/day	176.96 min
Average Free / Unaccounted Time/day	281.08 min

2. Index Values

Enter the final value generated by your Python program. The activity indicators are based on simple averages across valid recorded days. PAI is calculated using the predefined weights shown below.

Index Name	Acronym	Formula	Value to Enter
Personal Activity Index	**PAI**	**PAI =** 0.15(TPI) + 0.20(AAI) + 0.15(PhAI) + 0.20(SRI) + 0.15(TUI) + 0.10(EI) + 0.05(DCI)	370.65
Tech Productivity	**TPI**	**TPI =** Average(Coding Time per valid recorded day)	54.49 min/day
Academic Activity	**AAI**	**AAI =** Average(Study Time + Class Time per valid recorded day)	442.77 min/day
Physical Activity	**PhAI**	**PhAI =** Average(Fitness Time per valid recorded day)	51.41 min/day
Sleep & Recovery	**SRI**	**SRI =** Average(Sleep Time per valid recorded day)	433.33 min/day
Activity Balance	**ABI**	**ABI =** Average(Free / Unaccounted Time per valid recorded day)	281.08 min/day
Time Utilization	**TUI**	**TUI =** Average(Total Tracked Time per valid recorded day)	1158.92 min/day
Experience Index	**EI**	**EI =** Average of daily (Feeling Score + Satisfaction Score + Energy Score) / 3	2.88 / 5
Data Continuity Index	**DCI**	**DCI =** (Valid Recorded Days / Expected Days) × 100	108.33 %

Formula references: All time values are taken directly from the activity record and averaged across valid recorded days. Feeling, Satisfaction and Energy are scored using the prescribed 5/4/3/2/1, 5/4/3/2/1 and 3/2/1 scales respectively. PAI uses the predefined weights shown above. DCI rewards complete and continuous recording from 13 August 2026.

3. Key Findings from My Data

No.	Correlation/Observation	Evidence from my data
1	Sleep ↔ Energy	Correlation = 0.206 -> weak or little linear relationship. Higher sleep showed a slight positive link with energy
2	Study ↔ Satisfaction	Correlation = 0.089 ->weak or little linear relationship. Study time had

		almost no linear link with satisfactions
3	Coding ↔ Energy	Correlation = 0.067-> weak or little linear relationship. Coding time showed almost no relationship with energy level.
4	Academic load dominance	Average academic time (study + class) was 442.77 min/day – the largest activity block
5	Recording consistency (DCI)	Data continuity index was 108.33%(39 valid records vs 36 expected days), indicating strong recording consistency.

4. Findings About Myself (100–200 words)

Write about what your activity data revealed about your habits, priorities, consistency, balance, academic/technical engagement, and the relationship between activities and your reported experience.

I kept a record of my activities from 17 August to 21 September 2026. There are 39 valid days in my data. Looking at the results, study and class activities took up most of my time. My average study time was 237.64 minutes, and I spent about 205.13 minutes in class each day. So, my Academic Activity Index came to 442.77 minutes. My average sleep time was 433.33 minutes, which is about 7 hours and 13 minutes. I also spent some time on coding and fitness, with averages of 54.49 minutes and 51.41 minutes per day. Around 281.08 minutes were left as free or unrecorded time. My Experience Index was 2.88 out of 5. From these results, I feel that my routine was mainly focused on academic work. At the same time, I can see that I was not giving a very large amount of time to coding and fitness. The correlation values were also low, so the activities in the data did not show a strong relationship with my daily experience score.

5. Areas and Ways to Improve My Lifestyle (100–200 words)

Identify the areas you would like to improve and describe specific, realistic ways in which you intend to improve them based on the evidence from your data.

After looking at my data, I have decided to work on three main areas. The first one is coding. At present, I spend about 54.49 minutes per day on coding, so I want to increase this to around 90–120 minutes by keeping a fixed time for coding in the evening. The second area is fitness. I currently spend about 51.41 minutes on fitness, and I would like to make it at least 60–75 minutes on most days. This could be a

simple morning walk or a short workout. The third area is sleep. My average sleep is 433.33 minutes, so I want to move closer to 480 minutes, which is 8 hours. For this, I can try to maintain a more regular sleeping time. The sleep-energy correlation is 0.206, which is a weak positive relationship, but it still makes me interested in seeing whether better sleep affects my energy. I also plan to record my satisfaction after study sessions so I can compare it with my study time. I will check these activities every week and see whether there is any improvement in my TPI, PhAI, SRI and EI values.

6. Student Declaration

I confirm that the values entered in this report have been generated from my submitted activity data using my Python program and that the report represents my own analysis.
